

Electro-Magnetic Pulse(EMP) Bomb by wouse101

Well due to even more hype heres how you build a real EMP bomb, this bomb is completely harmless to all people WITHOUT any electronic life support systems e.g. pace maker (so be sure to tell grandpa to say WELL AWAY FROM IT!):

stuff you will need:

- >miles of PURE copper wire (insulated)
- >An unfeasibly Large Power supply and capacitor
- >A container that does not conduct electricity
- >a time delay circuit with thyrisitor
- >a very large PURE iron core

THERE ARE NO EXPLOSIVES INVOLVED OR USED IN A EMP BLAST AT ALL! (unless you are using a Neutron bomb or nuclear device, which you can purchase from your local Black market arms dealer!=])

how to make:

>get your wire and wrap it around the on conducting container. you'll need to do this on a lathe or something at medium speed.

>place your iron core in the container. For best results use Pure iron as there is less EM hysteresis (for all you Non-physisist out there: it can get magnetic VERY VERY QUICKLY, same applies for the copper, or maybe you have access to some new alloy!=])This is your coil part.

>To get a hugh capacitor, crack open an old TV there should be one in there.be careful not to touch the +ve and -ve terminals now coz you'll get a shock. It won't kill you but if you have a weak heart or pace maker, it advised not to! If you have 2 capacitors, then you can link them in parallel and get twice the capacitance. (and who said school was for losers!! fuc 'em)

>find, build, or get some one to build and timer circuit with a High voltage/current Thyrisistor switch in it. Thyrisistors can switch on a current without switch bouncing like relays have a such things. MONOSTABLES WILL JUST GET FRIED!

>now hook up your capacitor to the input of the thyrisistor and hook up that to your coil component.

>charge Your hugmongus capacitor up by some method, i'll leave that up to you.select a suitable time for your timer and put some sort of electronic device near the bomb and turn the bomb and electronic device on. Or alternativly use and old tape or floppy with something recorded on it and put that next to it.

>THERE WILL BE NOT BLUE RIPPLES OR ANYTHING LIKE YOU SEE ON THE MOVIES WHEN IT GOES OFF! SO EXPECT NOTHING SPECIAL!

>Now try to play the tape or use the floppy, you will now see that (or hear that) there is now nothing on it! if this is so, then congrats! perhaps you ain't as dumb as you look! give yourself a pat on the back!

>now go find something to use it on like a security camera or someother thing!

BARE I MIND THIS IS ONLY THEORY, I HAVE YET NOT TRY IT. BUT FROM WHAT I HAVE LEARNT, IT SHOULD WORK!

I will also not be held responsible if you:

- 1.blow up or destroy your computer if you have placed the bomb near it and any perphiperals.
- 2.destroy any tape collections you may posses or file work you have on disk that have been damaged in the "blast".
3. destroyed any important equipment that you have.
