## Notes:

1. Specifications are guaranteed when tested as a downconverter in a 50 Ohm system at $+25^{\circ} \mathrm{C}$ with the nominal LO power. Specifications indicated as typical are not guaranteed.
2. Noise figure is typically within $\pm 0.5 \mathrm{~dB}$ of conversion loss for IF frequencies greater than 10 MHz .
3. Conversion loss typically degrades less than 0.5 dB at $+100^{\circ} \mathrm{C}$ and improves less than 0.5 dB at $-55^{\circ} \mathrm{C}$. Conversion loss is the combined value.
4. Measured with an IF quadrature hybrid whose amplitude and phase errors are 0.5 dB and 3 degrees maximum. An IF quadrature hybrid is not included.
5. Usable LO drives are up to 2 dB below to 3 dB above nominal.
6. See Application notes M112, for aid in selecting the outline and for mounting and installation information.

## Typical Performance at $\mathbf{2 5}^{\circ} \mathbf{C}$
