

# KETAMINE USE AS TRUTH SERUM

Ketamine is commercially sold as Ketalar and is a powerful anaesthetic used mainly by vets on farm animals, although it does have some human medical applications. It has gained popularity in some areas (it is supposedly quite popular in New York clubs at the time of writing) although its use is still comparatively rare. The supply is thought to come mainly from opportunistic thefts from vets premises and vehicles as it is not, on the whole, stored on farms.

It usually comes as a liquid in its pharmaceutical form (stolen vets supplies will probably come in this form) although it is also found as a white powder or pill. A 'wrap' of ketamine powder will cost between 10 to 25 with the price varying widely with location and availability.

It can be either snorted or swallowed as a powder and either swallowed or injected as a liquid. Injectors usually inject into the muscles rather than a vein.

Ketamine is called "dissociative" in action, which means that it feels as if the mind is "separated" from the body. Ketamine causes hallucinations (the user may feel as if they have entered another reality). Ketamine also works as an anaesthetic (a painkiller) and so stops the user feeling pain, which could lead the user to cause unwitting injury to him or herself. It also lowers the heart rate and so with larger doses it can lead to oxygen starvation to the brain and muscles. An overdose can also cause the heart to stop.

Like most anaesthetics, eating or drinking before taking ketamine may induce vomiting. Temporary paralysis has been reported in some users but is rare.

Ketamine stops the user feeling pain, which could lead the user to cause injury to him or herself without them knowing it. It also lowers the heart rate and so with larger doses it can lead to oxygen starvation to the brain and muscles. An overdose can also cause the heart to stop.

Tolerance (needing more and more to have the same effect) to ketamine can be quickly built up if it is used regularly. It is not known whether ketamine use can lead to psychological or physical dependence, although both may be likely in some individuals..

Due to this drug being relatively new on the street its long term effects are not really known. So some of the dangers from using Ketamine may not be known for many more years.

---

Use as truth serum:

It must be injected 10cc at a time into muscle tissue. Start with their biceps each side. Once they begin to bob and rotate or spin you can stop and begin. Wait at least 5 minutes before injecting again. If they refuse to tell the truth, inject 5cc at a time into the muscle tissue. Eventually they will not realize they are there and they will tell the truth. Usually whatever they think will come out of their mouth after 25 cc total injection.
